

# SpaceAdventure

## Lesson 5

### Description

Add a `start` method implementation to the `SpaceAdventure` class.

Welcome to our solar system!

There are 8 planets to explore.

You are currently on Earth, which has a circumference of 24859.82 miles.

What is your name?

Jane

Nice to meet you, Jane. My name is Eliza, I'm an old friend of Siri.

Let's go on an adventure!

Shall I randomly choose a planet for you to visit? (Y or N)

Huh?

Sorry, I didn't get that.

Y

Ok! Traveling to...

### Learning Outcomes

- Recognize that objects may only respond to methods defined as part of their own interface or parent interface hierarchy.
- Discover the Swift method implementation syntax.
- Analyze how readability and expressiveness may be side effects of proper abstraction of code.

### Vocabulary

class	method call	method definition
implement	func	parameter list
object		

## Materials

- **SpaceAdventure Lesson 5** Xcode project

## Opening

How can we get the `SpaceAdventure` object to know how to handle the `start` method call?

## Agenda

- Discuss how the `SpaceAdventure` object does not know how to handle the `start` method call.
- Add an empty implementation of the `start` method to the `SpaceAdventure` class.

```
class SpaceAdventure {  
  
    func start() {  
    }  
  
}
```

- Explain the method implementation syntax including the `func` keyword, method name, and empty parameter list.
- Return to **main.swift**, and observe how the Xcode error notices disappear.
- Discuss how the object now knows how to handle the `start` method call, but that it would not do much in response, because the method definition is empty.
- Cut and paste the existing code from **main.swift** into the body of the `SpaceAdventure` `start` method implementation.

```
func start() {  
    let numberOfPlanets = 8  
    let diameterOfEarth = 24859.82 // In miles, from pole to pole.  
    println("Welcome to our solar system!")  
    ...  
}
```

- Run the program (⌘R), and interact with the console (⇧⌘C) to demonstrate that the existing functionality remains intact.
- Discuss how **main.swift** now only creates a `SpaceAdventure` object, and tells the `SpaceAdventure` object to start.

```
let adventure = SpaceAdventure()  
adventure.start()
```

- Discuss whether or not **main.swift** has become more concise, readable and expressive.

## Closing

Although **main.swift** is now about space adventures, take a look at the `start` method implementation. How might we make this code more readable and expressive?

## Modifications And Extensions

- Our space adventure will include planetary systems and planets. Determine how one might model these concepts in the program, and how these concepts should be provided to our `SpaceAdventure` object. How might you model the solar system as code?
- Redefine the `SpaceAdventure` class as a Swift structure, and determine if structures can also support method implementations.
